Draft of claim 1 for RCE

1. An X-ray computer tomography apparatus having an X-ray radiation means comprising an X-ray generator and a two-dimensional X-ray image sensor, wherein an X-ray beam is radiated on an object to be examined for X-ray circulation radiation, while said X-ray generator and said two-dimensional X-ray image sensor move around said object with said object interposed therebetween, so as to keep their mutual facing positional relation, and wherein a first X-ray tomography is executed for obtaining a panoramic image and a second X-ray tomography is executed for obtaining a computed tomography image of an interested area of said object, said X-ray computer tomography apparatus comprising:
an object holding means,
an object moving means on which said object is set up,
a processing means for controlling said object moving means to move said object holding means depending on the changing of rotary angle of said X-ray rotary radiation means, for executing said first X-ray tomography, while said X-ray rotary radiation means rotates around said object during execution of said first X-ray tomography, with a center of said X-ray rotary being fixed relative to said apparatus.
